# NEIGHBORING COSMID INFORMATION:

The 5' cosmid is C18F10, 399 bp overlap; 3' cosmid is C31H11, 200 bp overlap. Actual start of this cosmid is at base position 200 of CELF47D12; actual end is at 41076 of CELF47D12

#### NOTES:

Coding sequences below are predicted from computer analysis, using the program Genefinder (P. Green and L. Hillier, ms in preparation).

RD full staff_review
This sample has been taken from patient M, one of the seven patients (A, M, L, F, C, V, R), in the study(1). All patients had acute, patients (A, M, L, F, C, V, R), in the study(1). All patients had acute, patients (A, M, L, F, C, V, R), in the study(1). All patients had acute, self-limited symptomatic illness with measurable viremia followed by seroconversion. Patient M was a chronically infected male who subsequently transmitted the virus to patient F. The authors report that the sequences in this study are found to be uniformly macrophage-tropic and non-syncyrlum-inducing. The sequence for sample M clone 6, along with other patient M clones 1, 2, 7-9, 11, 12, 14, 15, 17-23, and 32-34, is shown in alignment following the printed text entry. These env sequences cluster with HIV-1 B subtype sequences. See also L21224-L21591 and L24161, L24162.

All patients had acute, patients (A.M.L.F.C.V.R), in the study(1). All patients had acute, self-limited symptomatic illness with measurable viremia followed by seroconversion. Patient F was infected by patient M via sexual transmission. The authors report that the sequences in this study are found to be uniformly macrophage-tropic and nonsyncytium-inducing. The sequence for sample F clone 1, along with other patient F clones 2-15, and 17, is shown in alignment following the printed text entry. These env sequences cluster with HIV-1 B subtype sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         full staff_review

This sequence was obtained as part of a study designed to determine the breadth of genetic variation of SIV infecting African green monkeys. With this aim in mind, Jin et al. PCR-amplified, cloned and sequenced the LTR and partial envelope region from 12 isolates (ver-1, ver-2, gri-2, gri-3, sab-1, sab-2, sab-3, sab-4, tan-1, tan-17, tan40, and tan-49). These isolates were derived from different African green monkey species inhabiting various
                                                                                                                                                                                                                                                                                                                                                                              phylogenetic analysis suggests that each AGM species is infected with a distinct subtype of SIVagm. Interestingly, the sabaeus virk genome seems to be a mosaic of many viruses infecting different primate species [1]. Virus sab-1 forms a distinct lineage in the send of gag, clusters closest to the HIV2/SIVsm group in the 3 gag and 5 pol regions, and clusters closest to the other SIVagm lineages in the 3 pol, env and nef regions [1]. This feature was demonstrated for two viral sabaeus strains, sab-1 and sab-D37 (sequenced only over the 5' end of the pol gene). Jin et al. conclude that an ancestor of the sabaeus virus was a recombinant with two breakpoints: one roughly at codon 310 of gag and the other at the sabaeus virus was a recombinant of the pol gene of the sabaeus virus was a recombinant of the sabaeus virus was a viru
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SIVSABLC 10036 bp ss-RNA VRL 25-MAY-1994
Simian immunodeficiency virus (SIVagm) complete genomic sequence,
African green monkey isolate SIVagmSAB-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   geographical regions.
Virus sab-1 was derived from a wild female asymptomatic sabaeus African green monkey. She was caught in her natural habitat of Senegal and susequently exported to the United States. From the

Jackson Foundation Research Laboratory, 1500 East Gude Drive, Rockville, MD 20850. The authors group the outlying V169 gag sequence with their subtype E. The naming of this subtype was made independently of envelope subtype studies, and so gag sequences in this subtype are not necessarily related to envelope sequences classified as subtype E in the 1992 and 1993 compendiums.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Louwagie, J.J., McCutchan, F., Brennan, T., Peeters, M., Brennan, T., Sanders-Buell, E., Eddy, G., van der Groen, G., Fransen, K., Gershy-Damet, M., Deleys, R. and Burke, D. Phylogenetic analysis of gag genes from seventy international HTV-1 isolates provides evidence for multiple genotypes AIDS 7, 769-780 (1993)

Jackson Foundation Research Laboratory Rockville, Maryland. Twenty-one full length gp160 coding sequences from eight African countries (Djibouti, Gabon, Kenya, Senegal, Somalia, Uganda, Zaire, and Zambia) were sequenced and analyzed with thirty-two previously published full-length gp160 env sequences. Sequences DJ258, DJ259, K124, SE365, SM145, UG266, UG268, UG274, VI191, and VI525 have corresponding gag sequences published by Louwagie et. al. in AIDS 7, 769-780 (1993) and in the 1993 compendum. This sequence clusters with C subtype env sequences. See also accession numbers L22939-L22957 and L23064.

Clone 2/2 is infectious (in MT-2 cells) and its env sequence has been inserte in this entry: bases 7100-7608 (annotated below).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The small orfs include: orf 1, in size and position similar to vif but without statistically significant homology; orf 2 that is "tat" like; orfs 3 (denoted D in [1]) and 4 (denoted H in [1]) seen also in the Petaluma strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The PPR isolate is approximately 91% homologous to the previously characterized Petaluma isolate. The latter infected feline kidney cells and the G355-5 cell line but replicated less efficiently on feline PBL's. In contrast, PPR productively infects PBL's but not the other cell lines. The authors point out interesting differences in the LTRs and coding regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 (bases 1 to 9468)

                                                                                                                                 This sample is part of a set of sequences generated through the WH Global Programme on AIDS. The virus was derived from an asymptomatic individual, from Brazil, whose route of infection is thought to be due to homosexual contact. The blood sample was taken in 1992. This env sequence clusters with HIV-1 B subtype sequences. The full name of this sequence is HIV192BR017WHO.01_1gCR; it was presented in alignments in an abbreviated form in the April 94 Human Rettroviruses and AIDS compendium update as B2BR017W.01_1gCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SIVCPZ

                                                                                                 This transcript was derived from the Visna K1514 viral strain: 364 nucleotides truncated at the 3' end during cDNA synthesis were reconstructed with a fragment of the visna provirus lambda vis 109 clone before cloning.

The sequence before cloning.

The sequence consists of four exons. Comparison with the 9.4 kB full genomic sequence indicates that the four exons result from splicing at positions 303-304; 349-350 (coordinate 4888); and 501-502 (coordinate 6097) in the LTR, pol and env sequences. Transfent-expression assays performed in eucaryotic cells demonstrated that this cDNA clone has a trans-acting effect on transcription of the visna virus genes. The putative proteins vep and stm were produced in vitro; Vep appears to be a rev-like protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AACAATTTGATAAT 562
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sample is part of a set of sequences generated through the WHO Global Programme on AIDS. The virus was derived from an asymptomatic individual, from Brazil, whose route of infection is thought to be due to homosexual contact. The blood sample was taken in 1992. This env sequence clusters with HIV-1 B subtype sequences. The full name of this sequence is HIV192BR017WHO.01diisCD; it was presented in alignments in an abbreviated form in the April 94 Human Retroviruses and AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VLVTR 1174 bp ss-RNA VRL Visna lentivirus, strain K1514 cDNA; partial LTR,
                                                                                                                                                                                                                                                                                                                                                                                                                        J Virol 62, 4813-4818 (1988)

Tree analysis reveals that it likely arose prior to the branching of HIV2s and SIVs, i.e. the sooty mangabey and macague isolates. [1] calls attention to an extension of the gag-pol overlap region resulting in a dilated (by 20 residues) pol orf. The env cds begins at 6671; tat-exon1 at 6375 and rev-exon1 at 6601, with the possible donor splice site at 6665.

[2] presents information about the original visua lentivirus sequence (11), which indicates that it is not an isolate from sequence (11), which indicates that it is not an isolate from stepenence in the previously thought, but is from LVI-1, one of several antigenic variants isolated from sheep after experimental infection with visua virus 1514. In [2], the genome of visua virus 1514 was cloned and sequenced. The sequence in [2] differed from the originally reported sequence by 12 nucleotides in the envelope and 3' LTR, whereas an independently derived clone of LVI-1 (Gdovin and Clements, manuscript in preparation) showed no differences in the sequence of env and 3' LTR with the same regions in [1]. Furthermore, virus neutralization studies [2] showed that the Haase virus stock [1] is antigenically identical to LVI-1 and that the 1514 virus stock reported in [2] is distinct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               eature 6876..6878

COMMENT

TITLE

```
protein coding regions were inferred from the AIDS virus coding sequences and by computer analysis. Subgenomic mRNAs are probably produced. The S protein is thought to be the equivalent of the tat protein in HIV's. Two long adjacent ORF's (bases 5956-8907) appear, when taken together, to correspond to the env gene in other retroviruses. [1] proposes that the stop codon that interrupts what would otherwise be a longer ORF may be the result of having sequenced a defective viral genome. This stop codon is not present in [2] due to a substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at also the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 't' in [1] at the sequenced and substitution of a 'c' for the 'c' in [1] at the sequenced and substitution o

JRCSF and JRFL (see <HIVJRFL) were isolated from cerebral spinal fluid and brain tissue of the patient JR, who died with Kaposi's sarcoma and severe AIDS encephalopathy (Science 236, 819-822, 1987). Both clones are infectious, but JRFL productively infects macrophages while JRCSF does not. (Peripheral blood was not available from the patient).

Staphylococcus aureus contig SEQ ID #392.
Computer readable medium; vaccine; S.aureus infection; immunodetection; cellulitis; eyelid infection; food poisoning; osteomyelitis; therapy; skin infection; surgical wound infection; scalded skin syndrome; toxic shock syndrome; ds.
polynucleotide(s) and proteins derived from Staphylococcus aureus stored on computer readable medium and used in the production of anti-s.aureus vaccines Claim 1; Page 1287-1288; 3271pp; English.

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so
                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 97-374922/35.

                                                                                                                                    DNA encoding a Staphylococcus aureus protein of unknown function. Staphylococcus aureus protein; immune response induction; eye infection; antibody production; T-cell immune response; gastrointestinal infection; respiratory infection; inhibitor; bacterial infection; cardiac infection; central nervous system; kidney infection; urinary tract infection; antimicrobial compound identification; broad spectrum antibiotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food polsoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock and the Orange of the Company of the composition of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1774

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences (and their fragments) are useful as primers or probes for isolating homologues of any of the S. aureus DNA sequences contained on the computer readable medium.

Sequence 2424 BP; 839 A; 302 C; 462 G; 759 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1894
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1834
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1714
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1594

CC The invention relates to a UDP-N-acetylmuramate:L-alanine ligase CC (Murc polypeptide) encoded by the S. aureus Murc gene. Host cells CC (Murc polypeptide) encoded by the S. aureus Murc gene can be used for CC containing an expression system comprising the Murc gene can be used for the recombinant production of the polypeptide. And activity or CC polypeptide are used to treat conditions requiring increased activity or CC expression of the polypeptide. Antagonists, inhibitory nuclear acid or CC competitive polypeptide are useful for inhibiting the polypeptide e.g. CC bacterial (especially S. aureus) infections. They are also useful against CC The antibacterial agents are useful to treat in-dwelling devices for CC infection prevention or generally as wound treatments to prevent adhesion CC diagnosing or prognosing a (susceptibility to) disease, for raising CC antibodies; to identify modulators or specific receptors; in rational CC drug design and as an immunogen for vaccines. The Murc gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant Murc gene; CC immunitation and poly; to determine bacterial serotype; and for genetic composition or thromosomal mapping; to determine bacterial serotype; and for genetic composition of the polypeptide of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
                                                                                                                                                                          aureus UDP-N-acetylmuramate: L-alanine ligase (Murc polypeptide). Host C cell containing an expression system comprising the Murc gene can be used for the recombinant production of the polypeptide. Agonists or the Murc C polypeptide are used to treat conditions requiring increased activity or c expression of the polypeptide. Antagonists, inhibitory nucleic acid or C competitive polypeptide are useful for inhibiting the polypeptide e.g. C bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising c antibodies; to identify modulators or specific receptors; in rational C antibodies; to identify modulators or specific receptors; in rational C augustic and as an immunogen for vaccines. The Murc gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant Murc gene; for chromosomal mapping; to determine bacterial serotype; and for genetic

Claim 1; Page 1314-1315; 2084pp; English.

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1169

pr nucleic actu described infections

PS Disclosure; Page 13; 39pp; English.

CC The invention relates to a UDP-N-acetylmuramate:L-alanine ligase (Murc C Disclosure; Page 13; 39pp; English.

CC The invention relates to a UDP-N-acetylmuramate:L-alanine ligase (Murc C Disclosure; Page 13; 39pp; English.

CC The invention relates to a UDP-N-acetylmuramate:L-alanine ligase (Murc C Disclosure; Page 13; 39pp; English.

CC polypeptide) encoded by the S. aureus Murc gene can be used for the creation of the polypeptide. Appoints of the polypeptide or competitive polypeptide are useful for inhibiting the polypeptide or competitive polypeptide are useful for inhibiting the polypeptide e.g.

CC bacterial (especially S. aureus) infections. They are also useful against the infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising CC antibodies; to identify modulators or specific receptors; in rational drug design and as an immunogen for vaccines. The Murc gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant Murc gene; for chromosomal mapping; to determine bacterial serotype; and for genetic for chromosomal mapping; to determine bacterial serotype; and for the PCR immunisation. The present sequence represents a primer used for the PCR
                                                                                                                                                                                                                                                                                                                                                                                                                        FRESULT TO SEE STATE OF THE SULT TO SEE STATE

CC The present sequence encodes a protein from Streptococcus pneumoniae. The present sequence encoding the Streptococcus pneumoniae protein CC can be useful in vaccines for inducing protective antibodies against CC pneumonia, otilis media or meningitis. Probes based on the nucleic acid care used to detect Streptococcus infection (by usual hybridisation or CC amplification methods), also for isolating Streptococcus genes or their CC allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or CC monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive cc immunisation (optionally coupled to a toxin). Vaccines are administered, CC immunisation (optionally coupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally coupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally coupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin). Vaccines are administered, CC immunisation (optionally acoupled to a toxin).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                             The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (VS2134 to VS2524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences deploted in SEQ ID NO: 1 to 391. The nucleotide sequences deploted in SEQ ID NO: 1 to 391 (VS2134 to VS5524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S. pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mNAN, DNA or cDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the sequences to amplification primers derived from the conjunter-based system for importance, or extragence of the modulation and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for importance, or extragence of the modulation.
                                                                                                                     Query Match

RESULT ACCORDED TO THE SULT OF                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PT antis, aureus vaccines
PS Claim 1; Page 1907; 3271pp; English.
CC This sequence represents one of 5191 Staphylococcus aureus DNA sequences
CC of the invention. The DNA sequences are recorded on a computer readable
CC medium, preferably selected from a floppy or hard disk, random access
CC memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using
CC the S.aureus DNA sequences allows putative functions to be assigned so
CC that protein-encoding or regulatory regions of commercial, therapeutic or
CC industrial importance can be obtained. Specifically, sequences which are
CC likely to encode antigens have been identified and these polypeptides can
CC be used in a vaccine composition against S.aureus infection. The
CC saureus in a sample. S.aureus is implicated in numerous human diseases,
CC sincluding cellulitis, eyelid infections, food poisoning, osteomyelitis,
CC skin and surgical wound infections, scalded skin syndrome, toxic shock
CC syndrome, etc. Organisms transformed with the DNA sequences
CC industrial rangments) are useful as primers or probes for isolating
CC chomologues of any of the S.aureus DNA sequences
CC communitor resadable medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁

(GENO-) INST GENOMIC RES.
(UNII) UNIV JOHNS HOPKINS SCHOOL MEDICINE.
Bult CJ, Smith HO, Venter JC, White OR, Woese CR;
MPI: 98-169145/15.
The present sequence represents the large circular extrachromosomal element sequence of the Methanococcus jannaschii circular chromosome. The present invention describes M. jannaschii open reading frames from the
                                                                                                                                                         Complete genome sequence of methano-genic jannaschii - useful in identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               07-JAN-1997; 100117.

PT Prod. of single chain fusion protein, pref. antibody - comprises PT transforming host cells, e.g. E. coli with expression constructs PT composed of proteins or domains, linked by spacer peptide(s) PS Example; Page '28; 56pp; English.

CC The sequence is that of the PCR primer VLl, which is used in the CC modification, for in-frame fusions with the hinge coding region, CC of the 5'-end of Ox VL CDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC genome sequence. The invention also describes a computer based system CC for identifying fragments of the M. jannaschii genome that are CC homologous to target nucleotide sequences, comprising: (a) data storage means comprising the nucleotide sequence of the 164976, 58407 or 16550 by sequence (see V1209, V21210 and V21211), or a nucleotide sequence at CC least 99.9% identical to it; (b) search means for comparing a target CC sequence to the nucleotide sequence of the data storage means to CC identify a homologous sequence, and (c) retrieval means for obtaining CC the homologous sequence. The method, which is based on whole genome CC random sequencing of an autotrophic archaeon M. jannaschii, the genome CC of which consists of 3 physically distinct elements, a large circular CC chromosomal element (the 58407 bp sequence given in V21210), and a small circular extra-chromosomal element (the 16550 bp sequence given in CC v21211), can be used in the identification of M. jannaschii genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

They can be used to facilitate tagging of most human genes, for mapping locations of expressed genes on chromosomes, for individual or forensic identification, for mapping locations of disease-associated genes, for identification of tissue type, and for prepn. of antisense sequences, probes and constructs. EST00527 has a "poor" coding probability as evaluated using the coding-region prediction program CRM. See also Q59041-Q61440. Sequence 474 BP; 155 A; 88 C; 75 G; 153 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 93-272882/34.

Enriched oligonucleotides and corresp. sequences - used as markers for human genes transcribed in-vivo, facilitate tagging of most human genes

Example 4; Page 190; 500pp; English.
                                                                                                   Example; Fig 4; 56pp; English.

The sequence is that of an Ox VH-CBHI hinge-VL insert which was used as part of a method for cloning secretable, biologically active single chain antibodies (scabs) and other secretable fusion proteins having at least 2 distinct functional proteins or domains. Claim 1; Fig 2(1) and Fig 2(3); 66pp; English.

A gene for Bacillus thuringiensis (B.t) P-2 toxin having the DNA sequence specified in Fig 2 (N80591), or any portion or deriv. of it, is claimed. Also claimed is the protein encoded by the gene, having the corresponding specified AA sequence in P80548. In isolating the P-2 gene, the P-2 protein was purified from a donor strain of B.t var. kurstaki and the partial AA sequence of the P-2 protein was determined. P-2 gene-specific oligo probe (N80590) was synthesised based on the AA sequence. The P-2 toxin encoded by the cloned gene has insecticidal activity against lepidoptera and diptera insects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N80591 standard: DNA: 1370

Sequence 2, Application US/07621670
Patent No. 5254801
GENERAL INFORMATION:
APPLICANT: Dotson, Stanton B.
TITLE OF INVENTION: Heterologous Dominant Conditional Lethal
TITLE OF INVENTION: Genes and Use Thereof
NUMBER OF SEQUENCES: 22
